

# Plastic + Rubber Keypad Solutions

KDM "P+R keypads" solutions blend the benefits of a hard plastic first surface with the superior flexibility and sealing properties of a silicon keymat. This interface solution supports a large variety of colors, textures, with options for embossed artwork and finishing. It provides cost effective and advanced decoration options to enhance the aesthetics of the customer's device.

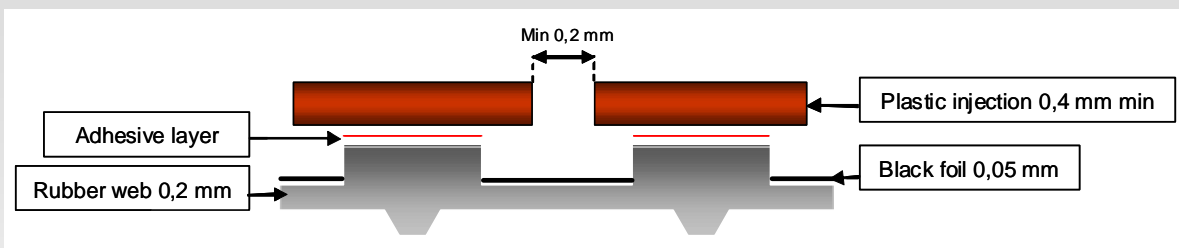

### Product Features

The keypad solution enables multiple colors to be sprayed or printed. Metal cosmetic options include traditional chrome plating, vacuum metallization (including non conductive options), textures, graphics & enhanced backlighting effects.

Decoration can be either on 1<sup>st</sup> or 2<sup>nd</sup> surface, depending on your cosmetic and abrasion resistance requirements. This can be mixed with thin PC key-top and IMD key-tops to meet your design needs.

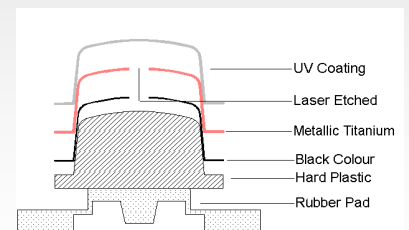

### Construction

### Customer Benefit

CoActive KDM P+R Keypad provide the benefits of much more expensive solutions:

- Variety of decoration finishes, textures and metallic color effects.
- Plastic key height >0.40 mm
- Sharp corner radius 0.1 mm
- Graphics with and/or without backlighting solutions
- Supreme abrasion resistance coatings of up to RCA 1000 cycles

Marketing and R&D teams are at your service for help you to define your solution.
